Adobe Photoshop 2021 (Version 22.2) Crack [2022]

This invention relates to a flat-plate type capacitor comprising two electrode plates each having an outer surface and a dielectric layer coated on the surface thereof and disposed between the two electrode plates, and more particularly it relates to a flat-plate type capacitor which is disposed in a flat casing having curved inner and outer surfaces and a novel casing structure which can be mass-produced with ease. The flat-plate type capacitor of the prior art is so-called because the outer and inner surfaces of the capacitor plates are disposed in parallel to one another; that is, the two capacitor plates are perpendicular to the direction of the thickness of the capacitor. In recent years, electronic and information devices have been rapidly miniaturized and developed in a vast range of fields. Accordingly, more and more attention has been paid to a thin and compact capacitor for use in such electronic and information devices. This is because, with an electronic circuit designed to be used in such thin and compact devices as portable or mobile units, it is necessary to miniaturize the electronic circuit itself as far as possible and the use of a capacitor in the circuit becomes more and more important. In one of the applications of such electronic and information devices, the capacitor is integrated with an integrated circuit (IC) chip and mounted on a printed circuit board. Heretofore, IC chips have been operated with a voltage range between 5.0 and 6.0 V and also have been directly mounted on printed circuit boards. In recent years, however, more and more IC chips have been operated with a voltage range between 3.0 and 5.0 V and therefore there has been an increasing demand for a capacitor having a voltage range of between 2.0 V and 5.0 V. In the prior art, since the flat-plate type capacitor is so constructed that the outer and inner surfaces of the two electrode plates are disposed in parallel to one another, a special casing having curved inner and outer surfaces is needed to enclose the flat-plate capacitor. For example, a case disclosed in U.S. Pat. No. 4,554,933 has curved inner and outer surfaces and has a concave portion formed between its inner and outer surfaces. This case is so constructed that the inner and outer surfaces of the case extend in parallel to one another, thereby ensuring the mechanical strength and the durability of the case. Another case disclosed in U.S. Pat. No. 4,572,622 comprises two electrode plates which are disposed between curved inner
